

# Redes e Comunicações

---

Intranetworking

# Internetworking Terms (1)

---

## ⌘ Communications Network

- ☒ Facility that provides data transfer service

## ⌘ An internet

- ☒ Collection of communications networks interconnected by bridges and/or routers

## ⌘ The Internet - note upper case I

- ☒ The global collection of thousands of individual machines and networks

## ⌘ Intranet

- ☒ Corporate internet operating within the organization
- ☒ Uses Internet (TCP/IP and http) technology to deliver documents and resources

# Internetworking Terms (2)

---

## ⌘ End System (ES)

- ☑ Device attached to one of the networks of an internet
- ☑ Supports end-user applications or services

## ⌘ Intermediate System (IS)

- ☑ Device used to connect two networks
- ☑ Permits communication between end systems attached to different networks

# Internetworking Terms (3)

---

## ⌘ Bridge

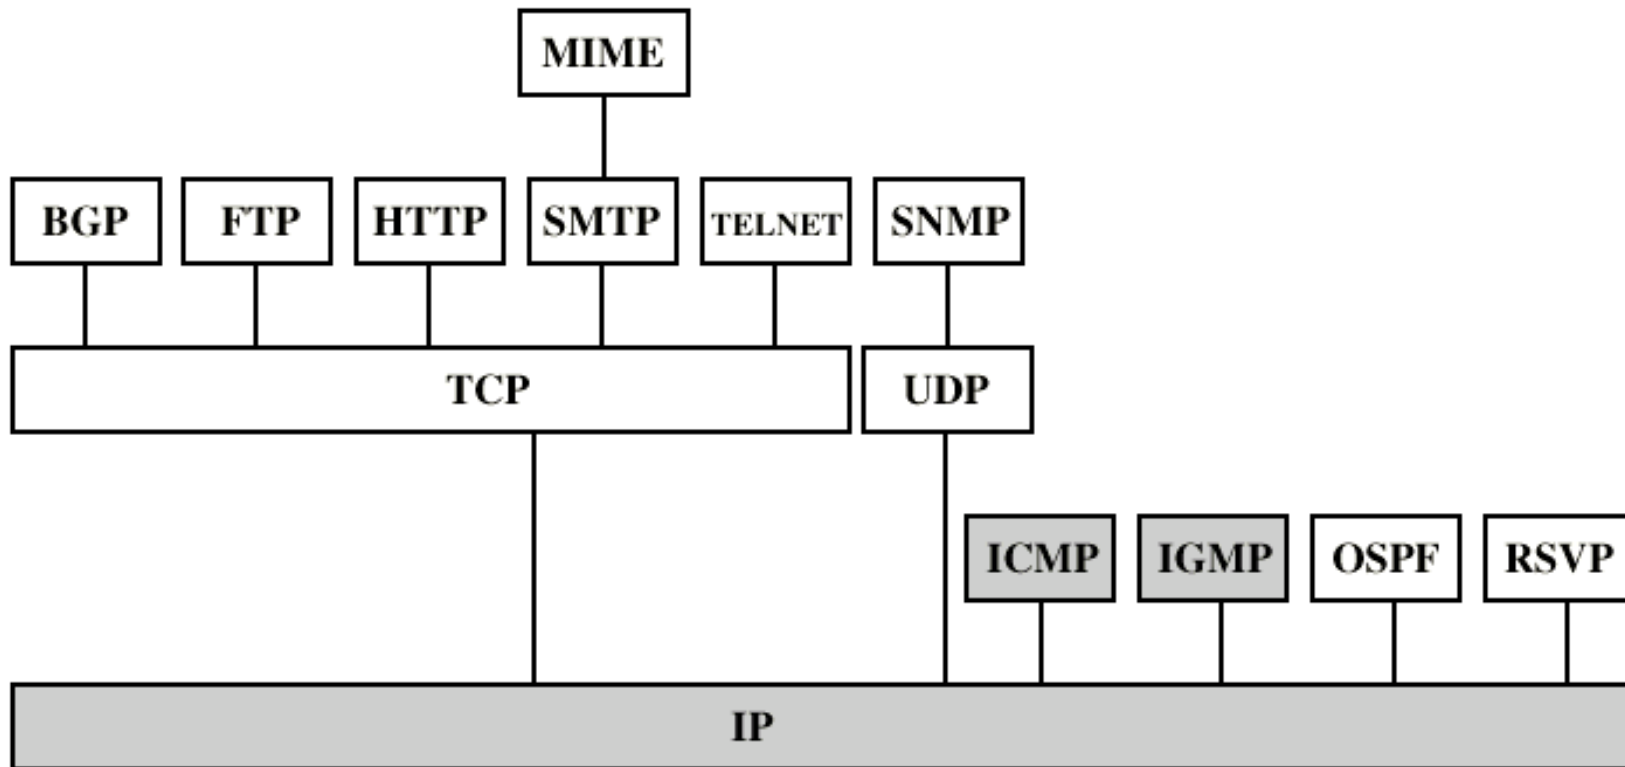

- ☑ IS used to connect two LANs using similar LAN protocols
- ☑ Address filter passing on packets to the required network only
- ☑ OSI layer 2 (Data Link)

## ⌘ Router

- ☑ Connects two (possibly dissimilar) networks
- ☑ Uses internet protocol present in each router and end system
- ☑ OSI Layer 3 (Network)

# Internetworking Protocols

---

# Requirements of Internetworking

---

- ⌘ Link between networks
  - ⏏ Minimum physical and link layer
- ⌘ Routing and delivery of data between processes on different networks
- ⌘ Accounting services and status info
- ⌘ Independent of network architectures

# Network Architecture Features

---

- ⌘ Addressing
- ⌘ Packet size
- ⌘ Access mechanism
- ⌘ Timeouts
- ⌘ Error recovery
- ⌘ Status reporting
- ⌘ Routing
- ⌘ User access control
- ⌘ Connection based or connectionless

# Architectural Approaches

---

⌘ Connection oriented

⌘ Connectionless

# Connection Oriented

---

- ⌘ Assume that each network is connection oriented
- ⌘ IS connect two or more networks
  - ⌘ IS appear as DTE to each network
  - ⌘ Logical connection set up between DTEs
    - ⌘ Concatenation of logical connections across networks
  - ⌘ Individual network virtual circuits joined by IS
- ⌘ May require enhancement of local network services
  - ⌘ 802, FDDI are datagram services

# Connection Oriented IS Functions

---

- ⌘ Relaying

- ⌘ Routing

- ⌘ e.g. X.75 used to interconnect X.25 packet switched networks

- ⌘ Connection oriented not often used

  - ⌘ (IP dominant)

# Connectionless Operation

---

- ⌘ Corresponds to datagram mechanism in packet switched network
- ⌘ Each NPDU treated separately
- ⌘ Network layer protocol common to all DTEs and routers
  - ⌘ Known generically as the internet protocol
- ⌘ Internet Protocol
  - ⌘ One such internet protocol developed for ARPANET
  - ⌘ RFC 791 (Get it and study it)
- ⌘ Lower layer protocol needed to access particular network

# Connectionless Internetworking

---

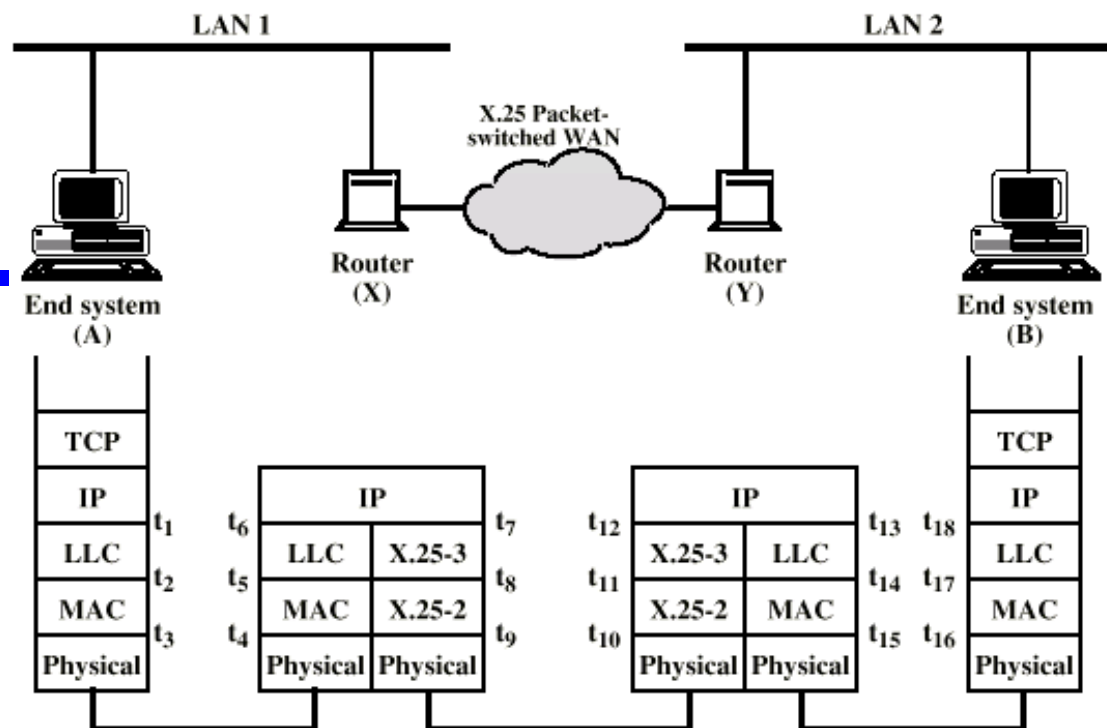

## ⌘ Advantages

- ☑ Flexibility
- ☑ Robust
- ☑ No unnecessary overhead

## ⌘ Unreliable

- ☑ Not guaranteed delivery
- ☑ Not guaranteed order of delivery
  - ☒ Packets can take different routes
- ☑ Reliability is responsibility of next layer up (e.g. TCP)

# IP Operation

$t_1, t_6, t_7, t_{12}, t_{13}, t_{18}$

IP-H	TCP-H	Data
------	-------	------

$t_2, t_5$

LLC1-H	IP-H	TCP-H	Data
--------	------	-------	------

$t_3, t_4$

MAC1-H	LLC1-H	IP-H	TCP-H	Data	MAC1-T
--------	--------	------	-------	------	--------

$t_8, t_{11}$

XP-H	IP-H	TCP-H	Data
------	------	-------	------

$t_9, t_{10}$

XL-H	XP-H	IP-H	TCP-H	Data	XL-T
------	------	------	-------	------	------

$t_{14}, t_{17}$

LLC2-H	IP-H	TCP-H	Data
--------	------	-------	------

$t_{15}, t_{16}$

MAC2-H	LLC2-H	IP-H	TCP-H	Data	MAC2-T
--------	--------	------	-------	------	--------

TCP-H = TCP header  
 IP-H = IP header  
 LLCi-H = LLC header  
 MACi-H = MAC header

MACi-T = MAC trailer  
 XP-H = X.25 packet header  
 XL-H = X.25 link header  
 XL-T = X.25 link trailer

# Design Issues

---

- ⌘ Routing
- ⌘ Datagram lifetime
- ⌘ Fragmentation and re-assembly
- ⌘ Error control
- ⌘ Flow control

# Routing

---

## ⌘ End systems and routers maintain routing tables

- ☑ Indicate next router to which datagram should be sent

- ☑ Static

  - ☒ May contain alternative routes

- ☑ Dynamic

  - ☒ Flexible response to congestion and errors

## ⌘ Source routing

- ☑ Source specifies route as sequential list of routers to be followed

- ☑ Security

- ☑ Priority

## ⌘ Route recording

# Datagram Lifetime

---

## ⌘ Datagrams could loop indefinitely

- ☐ Consumes resources
- ☐ Transport protocol may need upper bound on datagram life

## ⌘ Datagram marked with lifetime

- ☐ Time To Live field in IP
- ☐ Once lifetime expires, datagram discarded (not forwarded)
- ☐ Hop count
  - ☒ Decrement time to live on passing through a each router
- ☐ Time count
  - ☒ Need to know how long since last router

## ⌘ (Aside: compare with Logan's Run)

# Fragmentation and Re-assembly

---

- ⌘ Different packet sizes

- ⌘ When to re-assemble

  - ☐ At destination

    - ☒ Results in packets getting smaller as data traverses internet

  - ☐ Intermediate re-assembly

    - ☒ Need large buffers at routers

    - ☒ Buffers may fill with fragments

    - ☒ All fragments must go through same router

      - Inhibits dynamic routing

# IP Fragmentation (1)

---

⌘ IP re-assembles at destination only

⌘ Uses fields in header

▢ Data Unit Identifier (ID)

▢ Identifies end system originated datagram

- Source and destination address
- Protocol layer generating data (e.g. TCP)
- Identification supplied by that layer

▢ Data length

▢ Length of user data in octets

# IP Fragmentation (2)

---

## ⌞ Offset

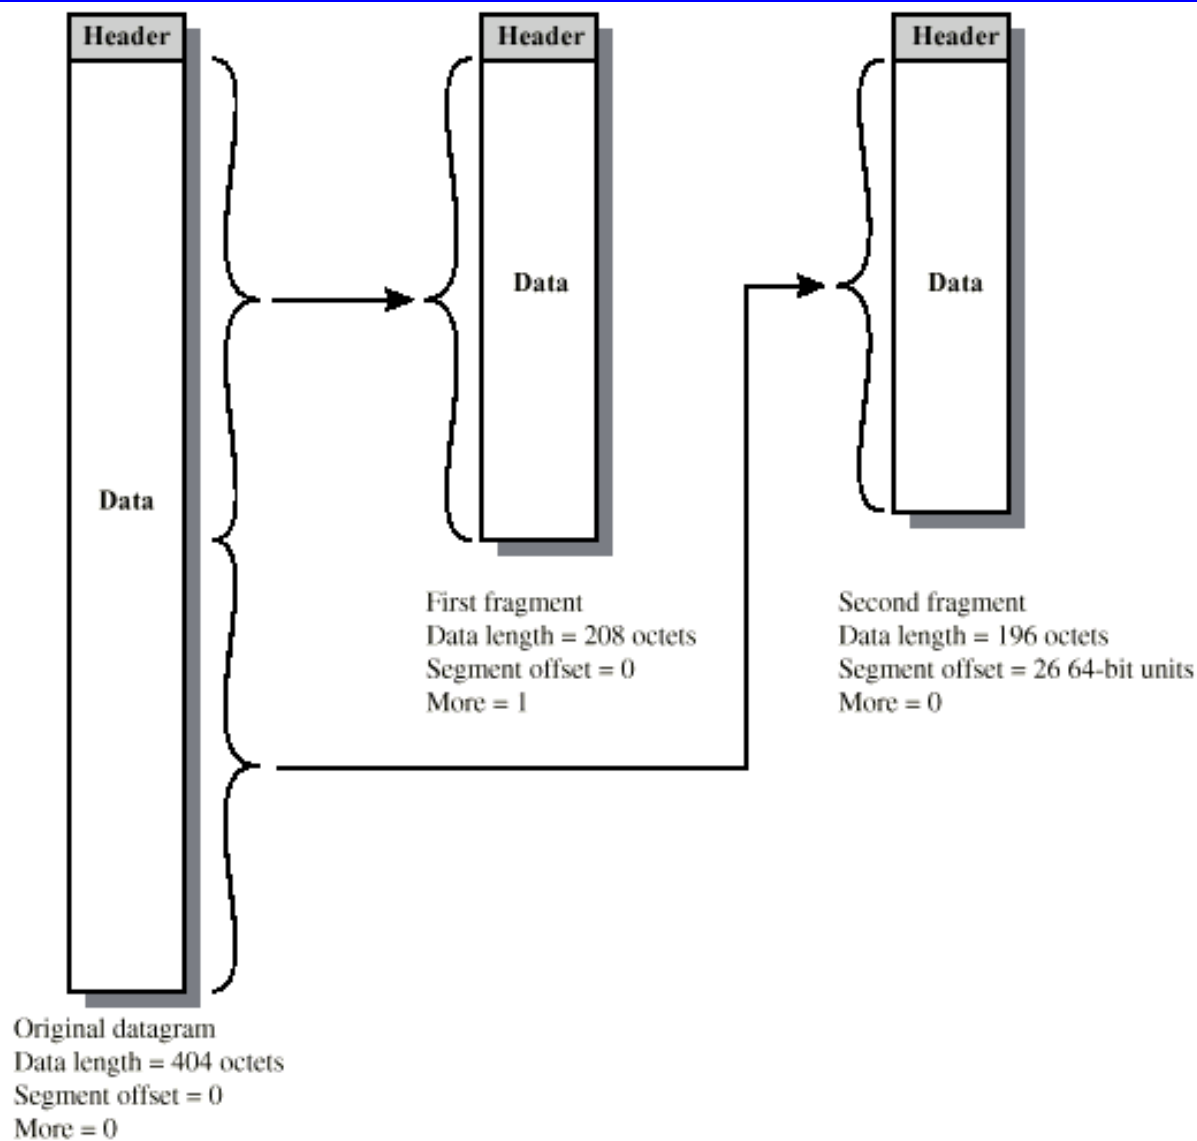

- ⊗ Position of fragment of user data in original datagram
- ⊗ In multiples of 64 bits (8 octets)

## ⌞ *More* flag

- ⊗ Indicates that this is not the last fragment

# Fragmentation Example

---

# Dealing with Failure

---

- ⌘ Re-assembly may fail if some fragments get lost
- ⌘ Need to detect failure
- ⌘ Re-assembly time out
  - ☐ Assigned to first fragment to arrive
  - ☐ If timeout expires before all fragments arrive, discard partial data
- ⌘ Use packet lifetime (time to live in IP)
  - ☐ If time to live runs out, kill partial data

# Error Control

---

- ⌘ Not guaranteed delivery
- ⌘ Router should attempt to inform source if packet discarded
  - ☐ e.g. for time to live expiring
- ⌘ Source may modify transmission strategy
- ⌘ May inform high layer protocol
- ⌘ Datagram identification needed
- ⌘ (Look up ICMP)

# Flow Control

---

- ⌘ Allows routers and/or stations to limit rate of incoming data
- ⌘ Limited in connectionless systems
- ⌘ Send flow control packets
  - ⏏ Requesting reduced flow
- ⌘ e.g. ICMP

# Internet Protocol (IP)

---

- ⌘ Part of TCP/IP

  - ☑ Used by the Internet

- ⌘ Specifies interface with higher layer

  - ☑ e.g. TCP

- ⌘ Specifies protocol format and mechanisms

# IP Services

---

## ⌘ Primitives

- ⊞ Functions to be performed
- ⊞ Form of primitive implementation dependent
  - ⊞ e.g. subroutine call
- ⊞ Send
  - ⊞ Request transmission of data unit
- ⊞ Deliver
  - ⊞ Notify user of arrival of data unit

## ⌘ Parameters

- ⊞ Used to pass data and control info

# Parameters (1)

---

- ⌘ Source address

- ⌘ Destination address

- ⌘ Protocol

  - ☐ Recipient e.g. TCP

- ⌘ Type of Service

  - ☐ Specify treatment of data unit during transmission through networks

- ⌘ Identification

  - ☐ Source, destination address and user protocol

  - ☐ Uniquely identifies PDU

  - ☐ Needed for re-assembly and error reporting

  - ☐ Send only

# Parameters (2)

---

## ⌘ Don't fragment indicator

- ☑ Can IP fragment data
- ☑ If not, may not be possible to deliver
- ☑ Send only

## ⌘ Time to live

- ☑ Send onl

## ⌘ Data length

## ⌘ Option data

## ⌘ User data

# Type of Service

---

## ⌘ Precedence

☐ 8 levels

## ⌘ Reliability

☐ Normal or high

## ⌘ Delay

☐ Normal or low

## ⌘ Throughput

☐ Normal or high

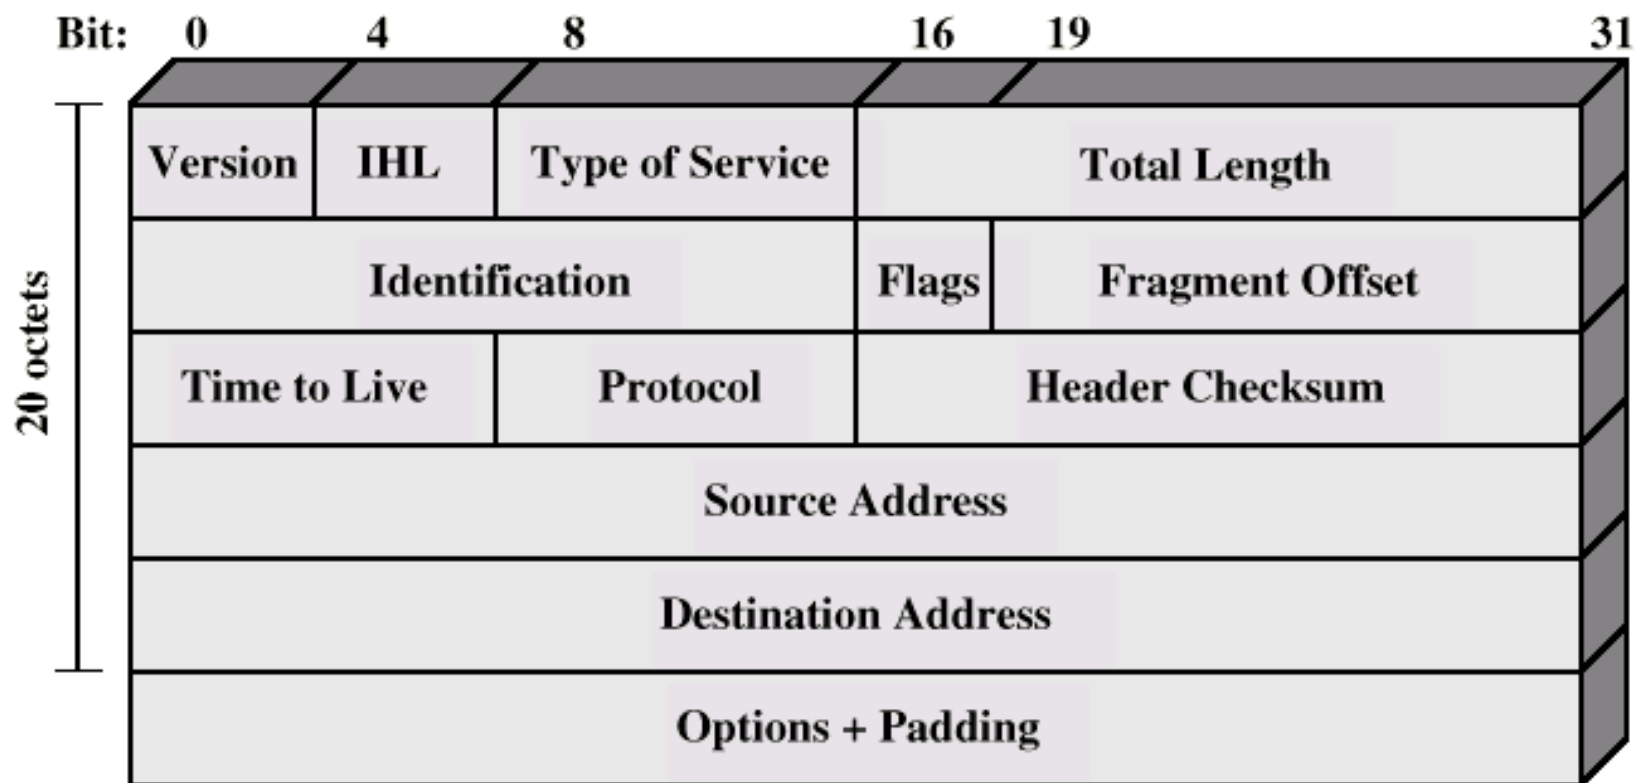

# Options

---

- ⌘ Security
- ⌘ Source routing
- ⌘ Route recording
- ⌘ Stream identification
- ⌘ Timestamping

# IP Protocol

---

# Header Fields (1)

---

## ⌘ Version

- ☐ Currently 4
- ☐ IP v6 - see later

## ⌘ Internet header length

- ☐ In 32 bit words
- ☐ Including options

## ⌘ Type of service

## ⌘ Total length

- ☐ Of datagram, in octets

# Header Fields (2)

---

## ⌘ Identification

- ☑ Sequence number
- ☑ Used with addresses and user protocol to identify datagram uniquely

## ⌘ Flags

- ☑ More bit
- ☑ Don't fragment

## ⌘ Fragmentation offset

## ⌘ Time to live

## ⌘ Protocol

- ☑ Next higher layer to receive data field at destination

# Header Fields (3)

---

## ⌘ Header checksum

- ☑ Reverified and recomputed at each router
- ☑ 16 bit ones complement sum of all 16 bit words in header
- ☑ Set to zero during calculation

## ⌘ Source address

## ⌘ Destination address

## ⌘ Options

## ⌘ Padding

- ☑ To fill to multiple of 32 bits long

# Data Field

---

- ⌘ Carries user data from next layer up
- ⌘ Integer multiple of 8 bits long (octet)
- ⌘ Max length of datagram (header plus data)  
65,535 octets

# IP Addresses - Class A

---

- ⌘ 32 bit global internet address
- ⌘ Network part and host part
- ⌘ Class A
  - ☑ Start with binary 0
  - ☑ All 0 reserved
  - ☑ 01111111 (127) reserved for loopback
  - ☑ Range 1.x.x.x to 126.x.x.x
  - ☑ All allocated

# IP Addresses - Class B

---

- ⌘ Start 10
- ⌘ Range 128.x.x.x to 191.x.x.x
- ⌘ Second Octet also included in network address
- ⌘  $2^{14} = 16,384$  class B addresses
- ⌘ All allocated

# IP Addresses - Class C

---

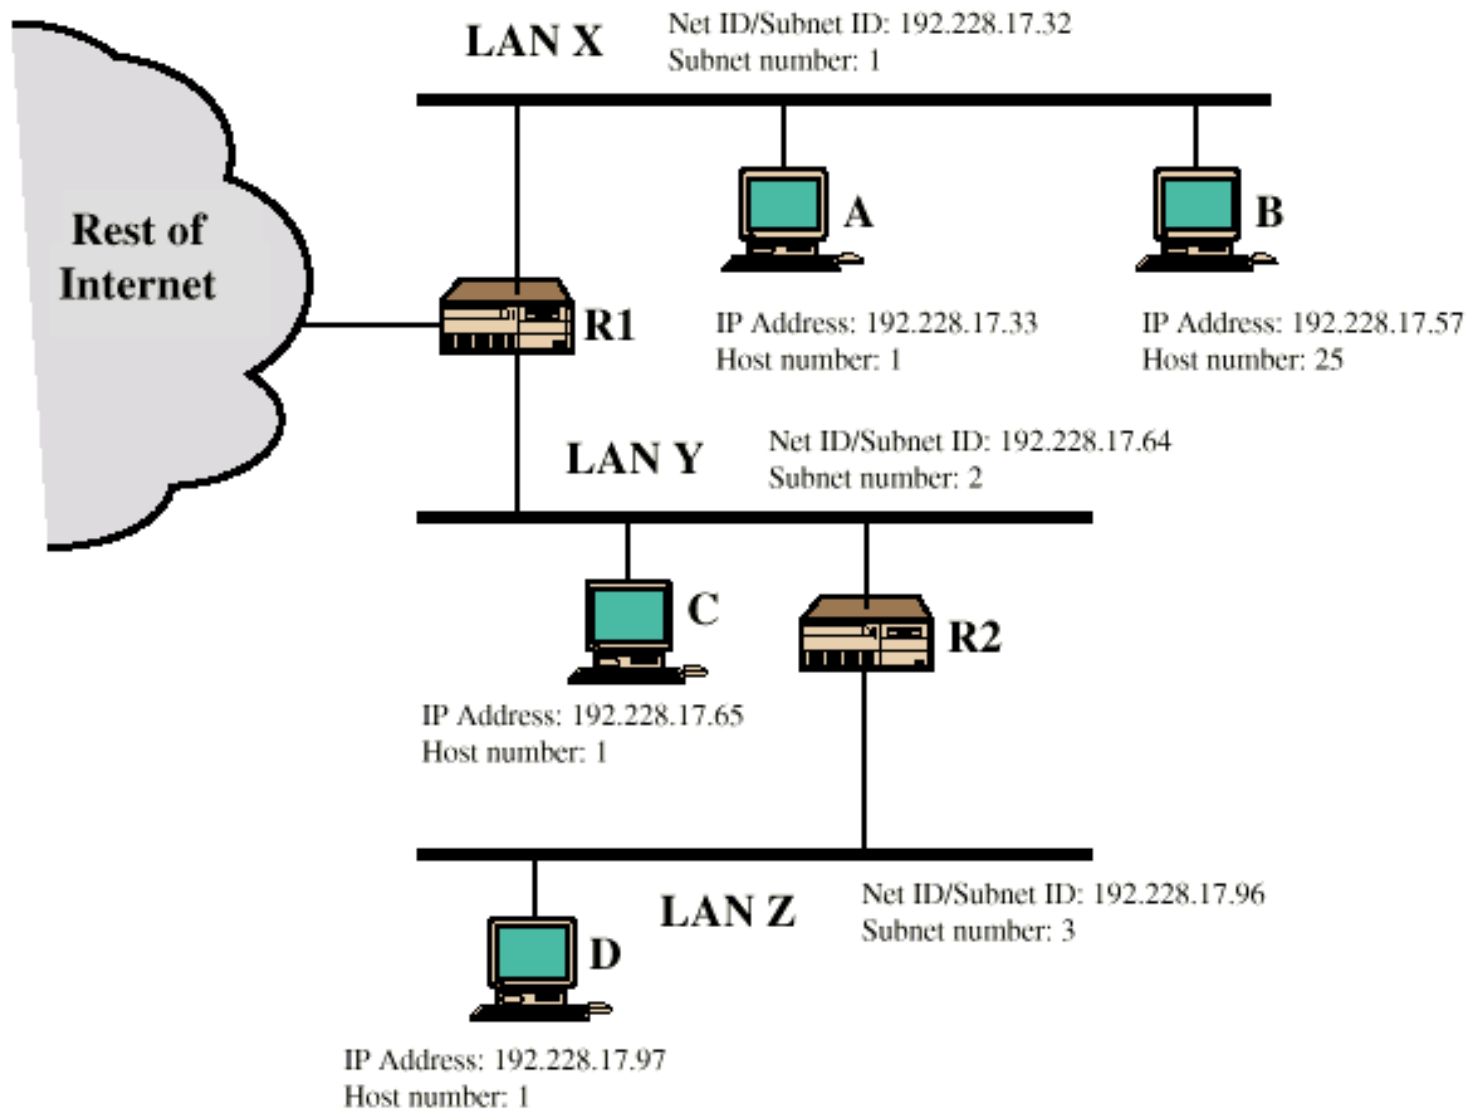

- ⌘ Start 110
- ⌘ Range 192.x.x.x to 223.x.x.x
- ⌘ Second and third octet also part of network address
- ⌘  $2^{21} = 2,097,152$  addresses
- ⌘ Nearly all allocated
  - ⏏ See IPv6

# Subnets and Subnet Masks

---

- ⌘ Allow arbitrary complexity of internetworked LANs within organization
- ⌘ Insulate overall internet from growth of network numbers and routing complexity
- ⌘ Site looks to rest of internet like single network
- ⌘ Each LAN assigned subnet number
- ⌘ Host portion of address partitioned into subnet number and host number
- ⌘ Local routers route within subnetted network
- ⌘ Subnet mask indicates which bits are subnet number and which are host number

# Routing Using Subnets

# ICMP

---

- ⌘ Internet Control Message Protocol
- ⌘ RFC 792 (get it and study it)
- ⌘ Transfer of (control) messages from routers and hosts to hosts
- ⌘ Feedback about problems
  - ⌘ e.g. time to live expired
- ⌘ Encapsulated in IP datagram
  - ⌘ Not reliable

# ICMP Message Formats

0	8	16	31
Type	Code	Checksum	
Unused			
IP Header + 64 bits of original datagram			

(a) Destination Unreachable; Time Exceeded; Source Quench

0	8	16	31
Type	Code	Checksum	
Identifier		Sequence Number	
Originate Timestamp			

(e) Timestamp

0	8	16	31
Type	Code	Checksum	
Pointer	Unused		
IP Header + 64 bits of original datagram			

(b) Parameter Problem

0	8	16	31
Type	Code	Checksum	
Identifier		Sequence Number	
Originate Timestamp			
Receive Timestamp			
Transmit Timestamp			

(f) Timestamp Reply

0	8	16	31
Type	Code	Checksum	
Gateway Internet Address			
IP Header + 64 bits of original datagram			

(c) Redirect

0	8	16	31
Type	Code	Checksum	
Identifier		Sequence Number	

(g) Address Mask Request

0	8	16	31
Type	Code	Checksum	
Identifier		Sequence Number	
Optional data			

(d) Echo, Echo Reply

0	8	16	31
Type	Code	Checksum	
Identifier		Sequence Number	
Address Mask			

(h) Address Mask Reply

# IP v6 - Version Number

---

- ⌘ IP v 1-3 defined and replaced
- ⌘ IP v4 - current version
- ⌘ IP v5 - streams protocol
- ⌘ IP v6 - replacement for IP v4
  - ☒ During development it was called IPng
  - ☒ Next Generation

# Why Change IP?

---

## ⌘ Address space exhaustion

- ☑ Two level addressing (network and host) wastes space
- ☑ Network addresses used even if not connected to Internet
- ☑ Growth of networks and the Internet
- ☑ Extended use of TCP/IP
- ☑ Single address per host

## ⌘ Requirements for new types of service

# IPv6 RFCs

---

- ⌘ 1752 - Recommendations for the IP Next Generation Protocol
- ⌘ 2460 - Overall specification
- ⌘ 2373 - addressing structure
- ⌘ others (find them)

---

## ⌘ Expanded address space

- ⌘ 128 bit

## ⌘ Improved option mechanism

- ⌘ Separate optional headers between IPv6 header and transport layer header
- ⌘ Most are not examined by intermediate routes
  - ⌘ Improved speed and simplified router processing
  - ⌘ Easier to extend options

## ⌘ Address autoconfiguration

- ⌘ Dynamic assignment of addresses

# IPv6 Enhancements (2)

---

## ⌘ Increased addressing flexibility

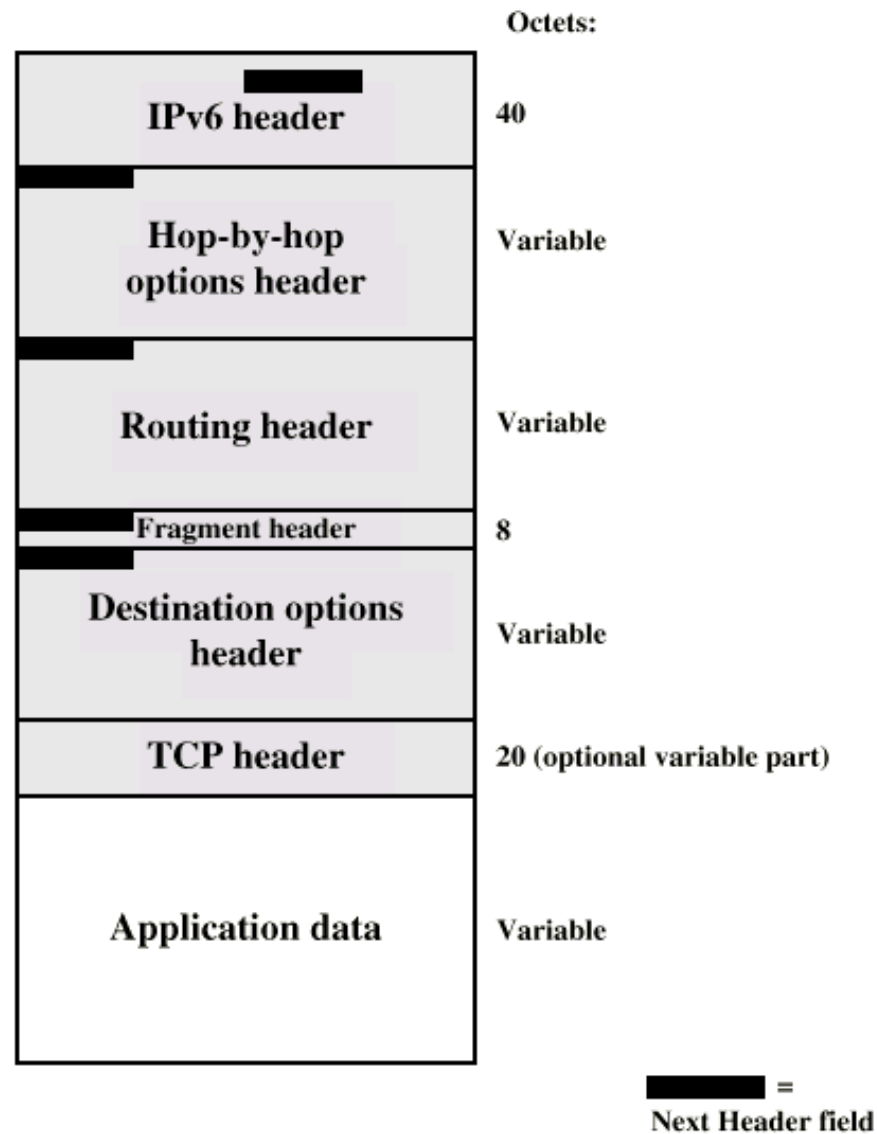

- ☑ Anycast - delivered to one of a set of nodes
- ☑ Improved scalability of multicast addresses

## ⌘ Support for resource allocation

- ☑ Replaces type of service
- ☑ Labeling of packets to particular traffic flow
- ☑ Allows special handling
- ☑ e.g. real time video

# Structure

---

# Extension Headers

---

## ⌘ Hop-by-Hop Options

- ☐ Require processing at each router

## ⌘ Routing

- ☐ Similar to v4 source routing

## ⌘ Fragment

## ⌘ Authentication

## ⌘ Encapsulating security payload

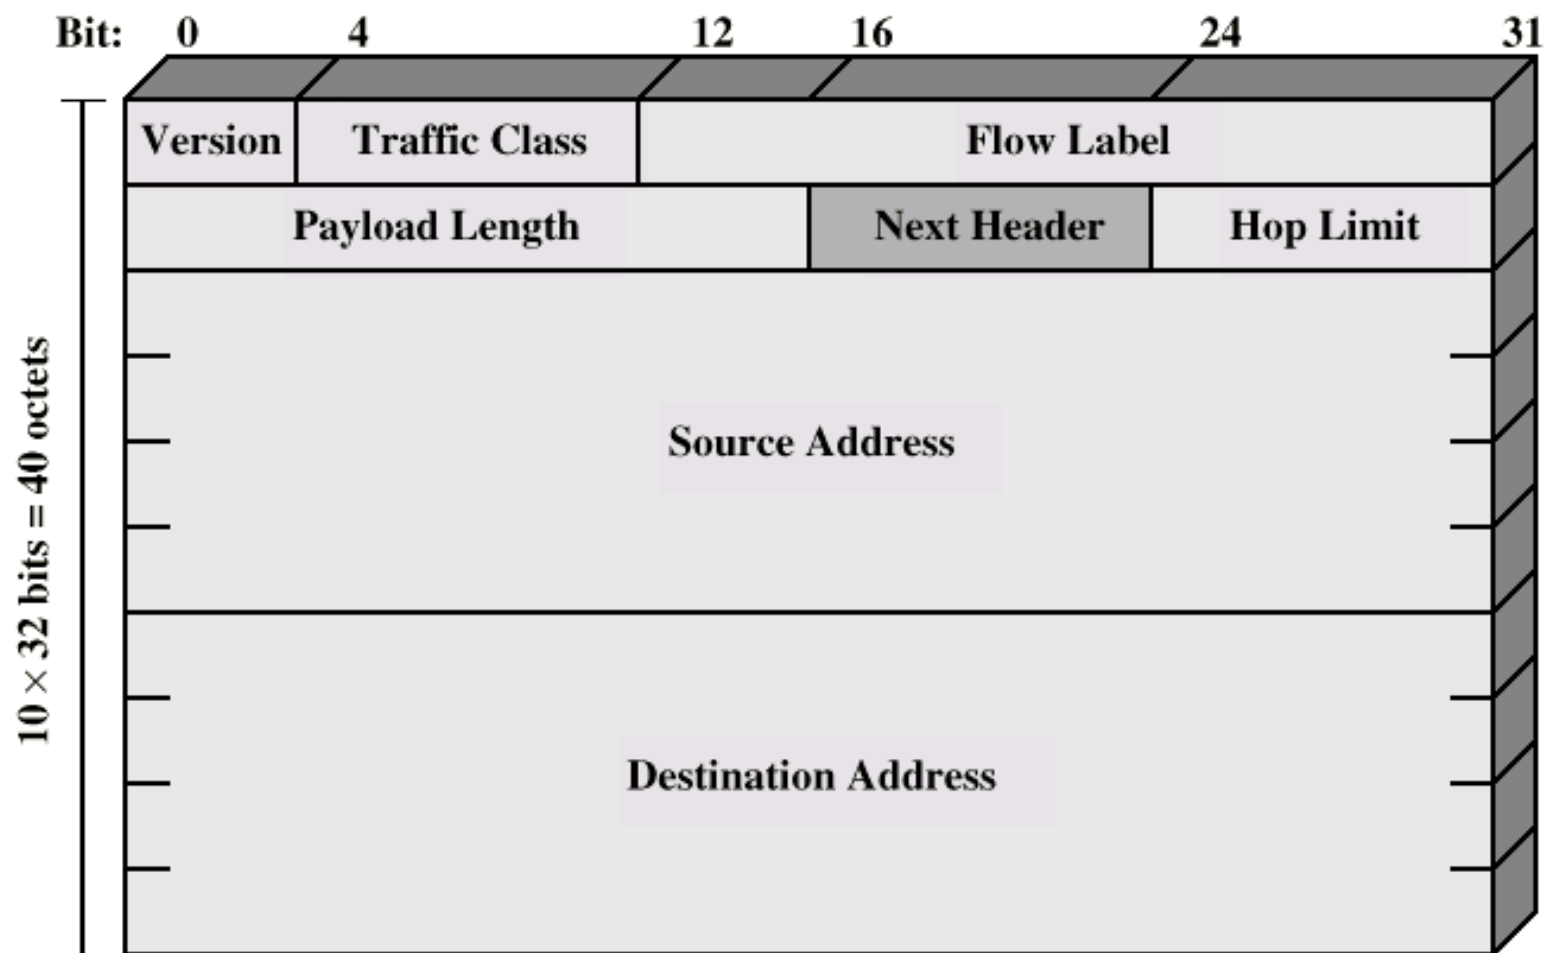

## ⌘ Destination options

- ☐ For destination node

# IP v6 Header

---

# IP v6 Header Fields (1)

---

## ⌘ Version

- ☑ 6

## ⌘ Traffic Class

- ☑ Classes or priorities of packet

- ☑ Still under development

- ☑ See RFC 2460

## ⌘ Flow Label

- ☑ Used by hosts requesting special handling

## ⌘ Payload length

- ☑ Includes all extension headers plus user data

# IP v6 Header Fields (2)

---

## ⌘ Next Header

- ⏏ Identifies type of header

- ⏏ Extension or next layer up

## ⌘ Source Address

## ⌘ Destination address

# IPv6 Addresses

---

- ⌘ 128 bits long
- ⌘ Assigned to interface
- ⌘ Single interface may have multiple unicast addresses
- ⌘ Three types of address

# Types of address

---

## ⌘ Unicast

- ☒ Single interface

## ⌘ Anycast

- ☒ Set of interfaces (typically different nodes)
- ☒ Delivered to any one interface
- ☒ the “nearest”

## ⌘ Multicast

- ☒ Set of interfaces
- ☒ Delivered to all interfaces identified

# Hop-by-Hop Options

---

- ⌘ Next header

- ⌘ Header extension length

- ⌘ Options

  - ⌘ Jumbo payload

    - ⌘ Over  $2^{16} = 65,535$  octets

  - ⌘ Router alert

    - ⌘ Tells the router that the contents of this packet is of interest to the router

    - ⌘ Provides support for RSVP (chapter 16)

# Fragmentation Header

---

- ⌘ Fragmentation only allowed at source
- ⌘ No fragmentation at intermediate routers
- ⌘ Node must perform path discovery to find smallest MTU of intermediate networks
- ⌘ Source fragments to match MTU
- ⌘ Otherwise limit to 1280 octets

# Fragmentation Header Fields

---

- ⌘ Next Header
- ⌘ Reserved
- ⌘ Fragmentation offset
- ⌘ Reserved
- ⌘ More flag
- ⌘ Identification

# Routing Header

---

- ⌘ List of one or more intermediate nodes to be visited
- ⌘ Next Header
- ⌘ Header extension length
- ⌘ Routing type
- ⌘ Segments left
  - ⏏ i.e. number of nodes still to be visited

# Destination Options

---

⌘ Same format as Hop-by-Hop options header

# Multicasting

---

⌘ Addresses that refer to group of hosts on one or more networks

⌘ Uses

- ☑ Multimedia “broadcast”
- ☑ Teleconferencing
- ☑ Database
- ☑ Distributed computing
- ☑ Real time workgroups

# Requirements for Multicasting (1)

---

- ⌘ Router may have to forward more than one copy of packet
- ⌘ Convention needed to identify multicast addresses
  - ☑ IPv4 - Class D - start 1110
  - ☑ IPv6 - 8 bit prefix, all 1, 4 bit flags field, 4 bit scope field, 112 bit group identifier
- ⌘ Nodes must translate between IP multicast addresses and list of networks containing group members
- ⌘ Router must translate between IP multicast address and network multicast address

# Requirements for Multicasting (2)

---

- ⌘ Mechanism required for hosts to join and leave multicast group
- ⌘ Routers must exchange info
  - ☐ Which networks include members of given group
  - ☐ Sufficient info to work out shortest path to each network
  - ☐ Routing algorithm to work out shortest path
  - ☐ Routers must determine routing paths based on source and destination addresses

# IGMP

---

- ⌘ Internet Group Management Protocol
- ⌘ RFC 1112
- ⌘ Host and router exchange of multicast group info
- ⌘ Use broadcast LAN to transfer info among multiple hosts and routers

# IGMP Format

---

# IGMP Fields

---

## ⌘ Version

☐ 1

## ⌘ Type

☐ 1 - query sent by router

☐ 0 - report sent by host

## ⌘ Checksum

## ⌘ Group address

☐ Zero in request message

☐ Valid group address in report message

# IGMP Operation

---

⌘ To join a group, hosts sends report message

- ☑ Group address of group to join
- ☑ In IP datagram to same multicast destination address
- ☑ All hosts in group receive message
- ☑ Routers listen to all multicast addresses to hear all reports

⌘ Routers periodically issue request message

- ☑ Sent to all-hosts multicast address
- ☑ Host that want to stay in groups must read all-hosts messages and respond with report for each group it is in

# Group Membership in IPv6

---

- ⌘ Function of IGMP included in ICMP v6
- ⌘ New group membership termination message to allow host to leave group
